

# PhotoBox Technical Test

## Requirements

1. Create a web page which displays a form with several text fields for entering data in two series (a bit like a spreadsheet).
2. Once some data has been entered the user should be given the option to display the data as a simple bar chart. It might look something like this:

3. Once the bar chart has been displayed, it should be possible to resize any of the bars using the mouse. In other words, if the user hovers over the top of the bar, they should be able to click and hold the mouse button to drag the bar to a different size. This should automatically adjust the numerical data entered to the corresponding new value.
4. The page you create should ideally work correctly in the latest stable versions of Internet Explorer, Firefox, Google Chrome and Safari.
5. It should be assumed that the code will be maintained and possibly extended by another developer in the team
6. You are free to use any libraries you think might be useful
